About the Seminar Topic

Python is a general purpose and high level programming language. Developing desktop, GUI applications, websites and web applications is the main objective of Python. Also, Python, as a high level programming language, allows us to focus on core functionality of the application by taking care of common programming tasks. The simple syntax rules of the programming language further makes it easier for you to keep the code base readable and application maintainable. There are also a number of reasons why prefer Python to other programming languages.

With the rise of big data, Python developers are in demand as data scientists, especially since Python can be easily integrated into web applications to carry out tasks that require machine learning. Being a very high level language, Python reads like English, which takes a lot of syntax-learning stress off coding beginners. Python handles a lot of complexity, so it is very beginner-friendly in that it allows beginners to focus on learning programming concepts and not have to worry about too much detail.

At the end of the session the online Quiz Competition was conducted by the resource person. All the audience have actively participated in this competition. **Mr. S.Desikan, AP/Mechanical Engineering** was the prize winner of this event and also he received cash award.
